ABSTRACT

A simplified procedure for preparing porous arm sockets is described. Preimpregnation of the stockinet and evaporation of solvent prior to lay-up result in a stronger, more porous socket.

INTRODUCTION

This is the third of a series of reports describing new methods for preparing porous laminates.

The first report, AMBRL Technical Report #6609 described a method for preparing PTB porous sockets. The second report, AMBRL Technical Report #6612 described the research findings that led to this development. This report describes methods for preparing porous arm prostheses.

Step 1. Mold Preparation

Prepare the stump model in the usual manner. Place the model in a vise, distal end up, and coat it with a release agent such as Hi-Glo*. Allow this coating to dry.

* Western States Lacquer, Dallas 12, Texas

Step 2. PVA Sheet

Moisten a sheet of polyvinyl alcohol (PVA) and stretch it down over the stump model. Tie at the base. If preferred, use a PVA sleeve and then cap with a sheet of PVA and heat seal.

Step 3. Sew Stockinet

A. Cut one length of Banlon stockinet and three lengths of orthopedic stockinet long enough to pull over stump model and tie to pipe. Turn Banlon inside out and sew end in a curve to match distal end of the stump. Sew orthopedic stockinet in a similar manner. Trim excess stockinet at the sewn end.

B. Now cut stockinet for outer socket as follows: 1 Banlon and 1 orthopedic stockinet, 3-5 inches longer than outer layup. Cut a second piece of orthopedic stockinet a little more than double the length of layup. Turn Banlon inside out.

Step 4. Roll a piece of PVA in a moistened towel.

Step 5. Weighing

Weigh all pieces of stockinet to the nearest gram.

Note: As the strength and porosity of the socket depend upon the amount of resin-solvent mixture, which is dependent on the stockinet weight, the next step is most important.

Step 6. Mixing Resin

Referring to Table I (use Table II for vacuum layup), go down the first column until you come to the weight of the stockinet. The amount of resin components will be found directly to the right in the next 3 columns.

For example: Stockinet weight = 70 grams; then, directly to the right under the column headed EPON 815, you will find a weight of 100 grams. Under column headed VERSAMID 140, you find 50 grams, and under METHYLENE CHLORIDE column, you find 100 grams. These are the amounts of each ingredient that should be mixed together for the 70 grams of stockinet.

Add pigment.

Step 7. Impregnating Stockinet

Pile the stockinet on top of each other and roll loosely. Place in the bottom of a polyethylene bag (8" x 12" or larger). Carefully pour all of the resin mixture into the bag onto the stockinet. Grasp the bag and knead to insure impregnation of all stockinet. This kneading only takes a minute or less.

Step 8. Inspecting Stockinet

Before removing the stockinet pieces from the bag, spread them apart and inspect for uniform impregnation. If some areas are underimpregnated, squeeze resin into these areas from other parts of the stockinet.

Step 9. Precure

Place pieces of stockinet side by side on paper towels and put into a circulating air oven set at 95 C (203 F) for exactly 5 minutes.

Step 10. Stockinet Layup

First, pull sewn Banlon over model and tie at proximal end. Then, pull the remaining sewn orthopedic stockinet over model and tie. Turn the last piece inside out before pulling over layup.

Pull moistened PVA sheet over layup and tie.

Step 11. Forearm Buildup

You are now ready for the forearm buildup. This buildup should be done in the usual manner, using either plaster of Paris or polyethylene wax. The plaster is preferred because the wax may get into the pores of the prosthesis. After the plaster has hardened, remove the paper or mylar cylinder and shape plaster (wax) to the desired contour. Remove any plaster from the knurled surface of the wrist unit. Coat plaster with Hi-Glo parting lacquer.

Step 12. PVA Sleeve

Prepare a PVA sleeve, moisten and pull down over the buildup and trim at the wrist unit.

Step 13. Layup Outer Banlon

Pull Banlon 1-2 inches over distal end and tie to wrist unit. Trim excess stockinet that is proximal to wrist unit.

Step 14. Layup Orthopedic Stockinet

Take the short piece of orthopedic stockinet and pull it over the long piece in such a manner that each piece meets at one end. (The outer end of the short piece should extend just past the middle of the long piece). Hold the Banlon stockinet extended above the wrist unit and slip these pieces of orthopedic stockinet (double end first) over the free end and down until the double piece covers the entire layup, with the other end of the short piece just distal to the wrist unit. Tie both pieces to the wrist unit, then stretch them tight and tie at the proximal end. The piece of Banlon should now be inside the untied end of orthopedic stockinet that extends beyond the wrist unit. Pull the remaining pieces of stockinet back over layup and tie at proximal end.

Step 15. Cure

Pull moistened PVA sleeve snugly over layup and tie at each end so there is smooth contact at all places between PVA and layup. Tape PVA sleeve around wrist unit to insure proper strength. Place layup into 95 C (203 F) oven for 2 hours.

Step 16. Mold Removal

While the laminate is still warm, cut the end of the layup to the desired length. The outer socket should separate easily from the inner socket.

The plaster may be removed by striking the stockinet with a rubber mallet. If necessary, use a chisel to dig the plaster out of the distal end of the socket. Remove any PVA film remaining by stripping by hand or if necessary, by dissolving the film with hot water.

Step 17. Trim

Hold the prosthesis firmly on the amputee's stump and mark the trim line. Remove the socket and trim in the usual manner. After the socket and forearm have been properly aligned, sand the edges and bond together with liquid epoxy resin (EPON 815 - 4 pts., Curing Agent T 1 - 1 pt.) Cure with a heat gun or place in an oven at 95 C (203 F) for 20 minutes.

Step 18. Test Porosity

Test the porosity of the finished prosthesis by holding it under a water tap and allowing the water to run through the prosthesis. If the prosthesis has been prepared properly, the laminate should show homogeneous porosity.

Step 19: Assemble

Complete harnessing in the usual manner. (note: Rivet holes should be reinforced with resin (4 parts EPON 815 to 1 part Curing Agent T 1).

Note: A similar technique may be used when utilizing a wax buildup if polyethylene wax is used.

INSTRUCTIONS

1. ORIGINATING ACTIVITY: Enter the name and address of the contractor, subcontractor, grantee, Department of Defense activity or other organization (*corporate author*) issuing the report.

2a. REPORT SECURITY CLASSIFICATION: Enter the overall security classification of the report. Indicate whether "Restricted Data" is included. Marking is to be in accordance with appropriate security regulations.

2b. GROUP: Automatic downgrading is specified in DoD Directive 5200.10 and Armed Forces Industrial Manual. Enter the group number. Also, when applicable, show that optional markings have been used for Group 3 and Group 4 as authorized.

3. REPORT TITLE: Enter the complete report title in all capital letters. Titles in all cases should be unclassified. If a meaningful title cannot be selected without classification, show title classification in all capitals in parenthesis immediately following the title.

4. DESCRIPTIVE NOTES: If appropriate, enter the type of report, e.g., interim, progress, summary, annual, or final. Give the inclusive dates when a specific reporting period is covered.

5. AUTHOR(S): Enter the name(s) of author(s) as shown on or in the report. Enter last name, first name, middle initial. If military, show rank and branch of service. The name of the principal author is an absolute minimum requirement.

6. REPORT DATE: Enter the date of the report as day, month, year, or month, year. If more than one date appears on the report, use date of publication.

7a. TOTAL NUMBER OF PAGES: The total page count should follow normal pagination procedures, i.e., enter the number of pages containing information.

7b. NUMBER OF REFERENCES: Enter the total number of references cited in the report.

8a. CONTRACT OR GRANT NUMBER: If appropriate, enter the applicable number of the contract or grant under which the report was written.

8b, 8c, & 8d. PROJECT NUMBER: Enter the appropriate military department identification, such as project number, subproject number, system numbers, task number, etc.

9a. ORIGINATOR'S REPORT NUMBER(S): Enter the official report number by which the document will be identified and controlled by the originating activity. This number must be unique to this report.

9b. OTHER REPORT NUMBER(S): If the report has been assigned any other report numbers (*either by the originator or by the sponsor*), also enter this number(s).

10. AVAILABILITY/LIMITATION NOTICES: Enter any limitations on further dissemination of the report, other than those imposed by security classification, using standard statements such as:

- (1) "Qualified requesters may obtain copies of this report from DDC."
- (2) "Foreign announcement and dissemination of this report by DDC is not authorized."
- (3) "U. S. Government agencies may obtain copies of this report directly from DDC. Other qualified DDC users shall request through _____."
- (4) "U. S. military agencies may obtain copies of this report directly from DDC. Other qualified users shall request through _____."
- (5) "All distribution of this report is controlled. Qualified DDC users shall request through _____."

If the report has been furnished to the Office of Technical Services, Department of Commerce, for sale to the public, indicate this fact and enter the price, if known.

11. SUPPLEMENTARY NOTES: Use for additional explanatory notes.

12. SPONSORING MILITARY ACTIVITY: Enter the name of the departmental project office or laboratory sponsoring (*paying for*) the research and development. Include address.

13. ABSTRACT: Enter an abstract giving a brief and factual summary of the document indicative of the report, even though it may also appear elsewhere in the body of the technical report. If additional space is required, a continuation sheet shall be attached.

It is highly desirable that the abstract of classified reports be unclassified. Each paragraph of the abstract shall end with an indication of the military security classification of the information in the paragraph, represented as (TS), (S), (C), or (U).

There is no limitation on the length of the abstract. However, the suggested length is from 150 to 225 words.

14. KEY WORDS: Key words are technically meaningful terms or short phrases that characterize a report and may be used as index entries for cataloging the report. Key words must be selected so that no security classification is required. Identifiers, such as equipment model designation, trade name, military project code name, geographic location, may be used as key words but will be followed by an indication of technical context. The assignment of links, rules, and weights is optional.
